The gap is between browsing and buying

Imported-portfolio users reach Exclusives, then do not self-convert.

Observed in Exclusives

Low-entry routes sit below long shelves.

The US $1 order route is deep on the page. Prices and an immediate buy path are absent.

This is a UI hypothesis, not a proven cause.

Working hypothesis

A familiar-company screener should make the first small order easier to start.

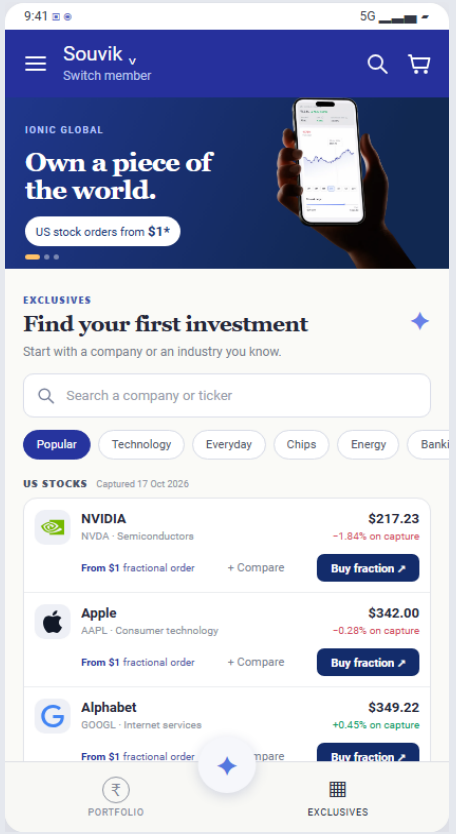

Show the company, captured price and fractional order route. Disclose funding and FX before order.

Test completed orders; taps alone cannot prove it.

Source: supplied Ionic app captures, 17 Oct 2026. Diagnosis is a hypothesis, not a measured cause.

The treatment: browse an actual company

Android screen: compact Ionic hero, then a searchable, priced stock list.

Start from something familiar

Search a company or use an industry filter.

See an actual instrument

Name, ticker, captured quote and daily move sit beside the fractional buy action.

Understand the order route

$1 is the order minimum. Account setup, funding and FX are shown before the order.

PMS, AIF and SIF open their full catalogues.

Mock uses captured product snapshots. Live orders require current prices, fees and product rules.

Measure completed self-serve orders

Randomize eligible Exclusives visitors against the preserved catalogue.

PRIMARY METRIC

Completed self-initiated investments within 7 days

per eligible visitor, split by US, mutual funds and basket

Read the full path

Family selected → facts viewed → detail → fees → order started → completed

Guardrails

Fee-stage abandonment · suitability contacts · reversals · concentration in high-risk products

Before launch: 5–8 moderated sessions; verify current product terms and return periods.
