The portfolio review is useful. The first purchase needs a clearer path.

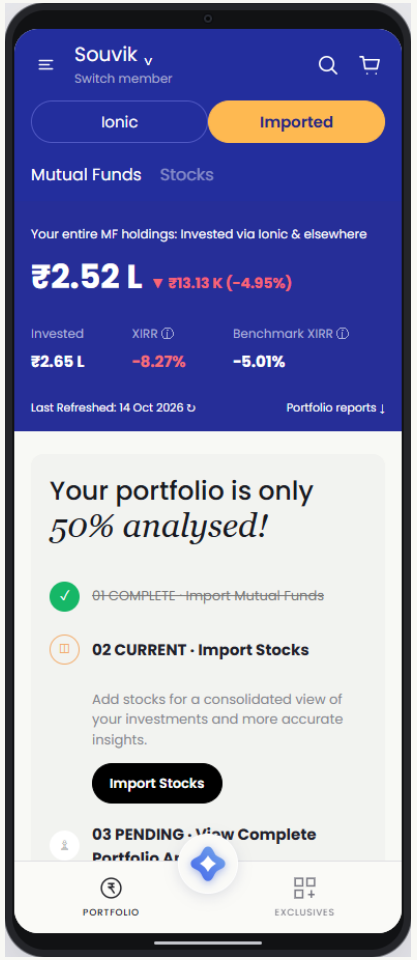

What seems to be happening

The product lead reports that people import their holdings for insights, but often need guidance before making their first purchase.

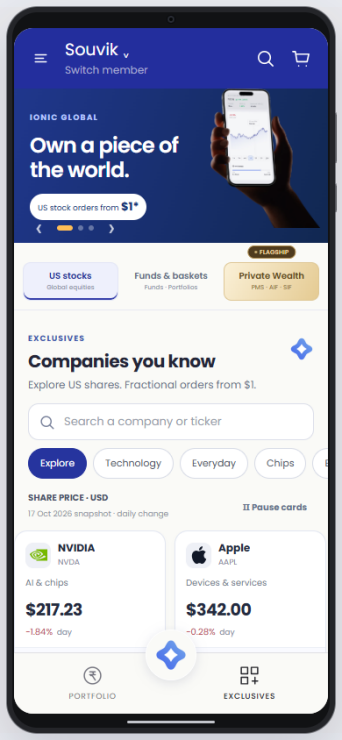

The existing Exclusives page asks them to browse long product shelves before finding an option with a smaller entry amount. They then still have to work out what to buy and how to begin.

Move the first useful choice up

Keep the hero. Put US stocks, funds and Private Wealth just below it, with enough product information to make an initial comparison.

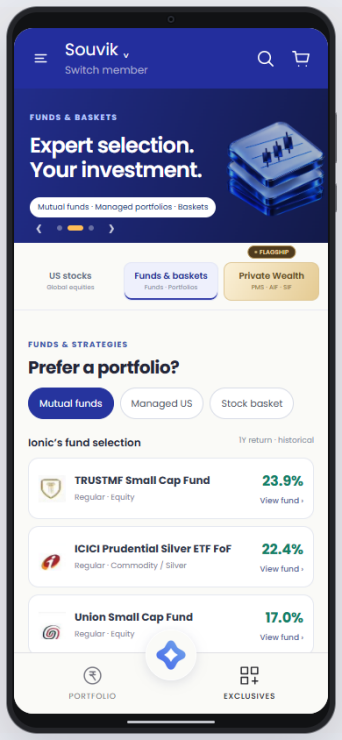

Three clear routes, without losing the full catalogue.

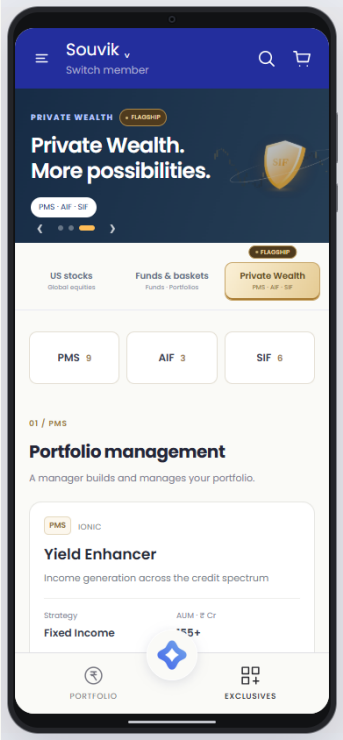

US stocks

Search familiar companies. See the share price and daily change before opening a product.

Funds & baskets

Keep mutual funds, managed US portfolios and the Ionic stock basket together, with their key facts.

Private Wealth

Give PMS, AIF and SIF a visible place. One scroll shows all 18 offerings, with shortcuts to each section.

Answer the questions that hold up the first purchase.

What am I buying?

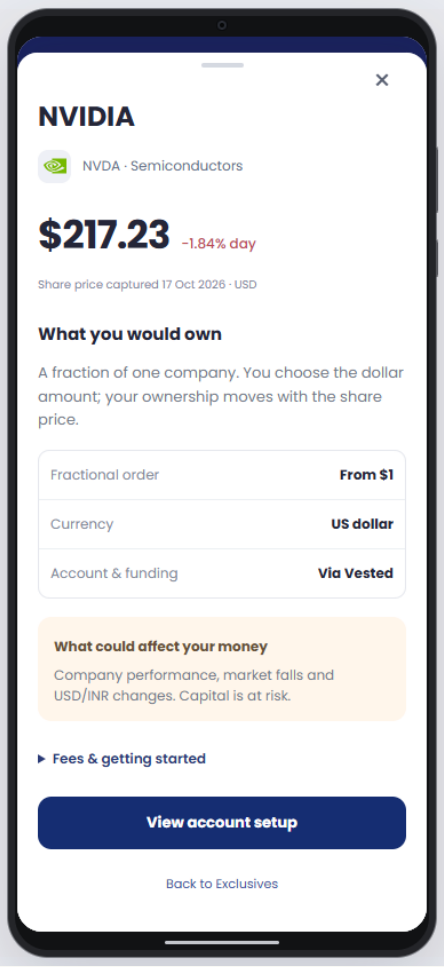

A stock card shows the full share price. The detail sheet explains that someone can buy a fraction from $1. Account funding and FX charges are separate.

What will it cost, and what could go wrong?

Keep ownership, fees and key risks together. If a fee or minimum is missing from the source screen, say what still needs to be checked with the provider.

What happens next?

Explain verification, funding and order review before the handoff. This gives the user a concrete next step and makes the setup requirements visible.

Why this is worth testing

If people can find an accessible option near the top and understand the costs, risks and next step, more should be able to complete a first investment without a call.

What the Android research tells us

A study of 145 students on Android 10 phones and tablets found that paging led to more revisiting of earlier information than scrolling. This gives us a reason to make comparison and returning to a product easier.

The study examined reading. It does not establish an Ionic scroll drop-off rate or a universal two-screen limit.

What investment research adds

Iyengar and Kamenica found that larger choice sets increased preference for simpler options in experiments and US retirement-plan data. That supports making the first choice easier to understand.

These were retirement choices. We still need to test the effect with Ionic users.

What would count as success?

Track first funded investments without assistance within seven days, alongside fee and risk understanding. Establish a baseline, split results by Android and iOS, and test card motion separately.
