A hypothesis about the first purchase

What we know

The product team reports portfolio imports without unassisted purchases. The captured Exclusives page has long product shelves; smaller entry routes sit further down.

What I would test

Put comparable products, costs and risks within the first two screens. Eligible importers should then be more likely to complete a first investment without a call.

74%

of viewing time fell within the first two screenfuls in NN/g's 2018 desktop study.

120 participants. This is an attention finding, not an Ionic mobile drop-off rate.

84%

say fee disclosure matters. 48% were satisfied. CFA Institute, 2018.

3,127 retail investors across 12 markets.

PROPOSED EXPERIENCE

A shorter route to a considered choice

Familiar products, useful facts

Company, exposure and price are visible on compact cards. Search narrows the set; it does not add another shelf.

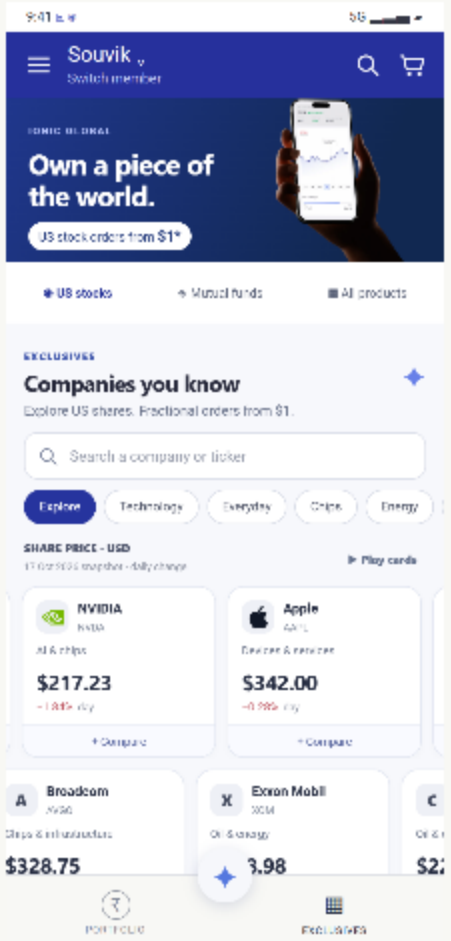

A comparison before commitment

Compare two companies, then open a stable detail screen for entry cost, currency exposure and account setup.

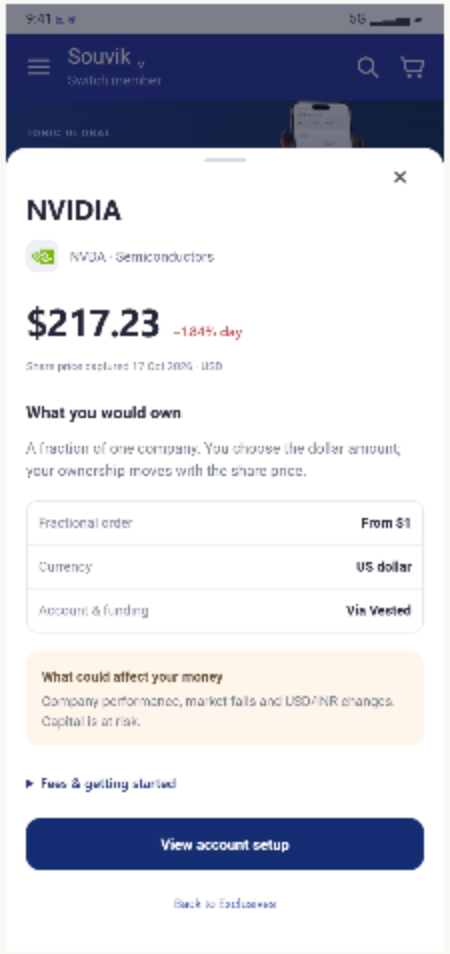

Motion is optional

Two slow, opposite rows. Pause on interaction; a visible pause button and reduced-motion support.

DISCOVERY

PRODUCT DETAILS

VALIDATION

Measure funded investments

Primary outcome

First unassisted investment within 7 days

Users who complete a first investment without assistance, divided by all eligible importers assigned to each experience.

A click is only a diagnostic

If product opens rise but funded orders do not, inspect KYC, funding and fees before concluding that discovery is solved.

Test the layout first

Current shelves vs compact, static cards.
Keep products and eligibility consistent.
Set sample size from the actual baseline.

Then test the motion

Static cards vs the two moving rows.
Ship only if comprehension and completed investments hold up—not just taps.

Check the cost of the improvement

Track assistance, risk/fee understanding, errors, cancellations and complaints.
