The gap between browsing and buying

The lowest-entry route sits below long product shelves.

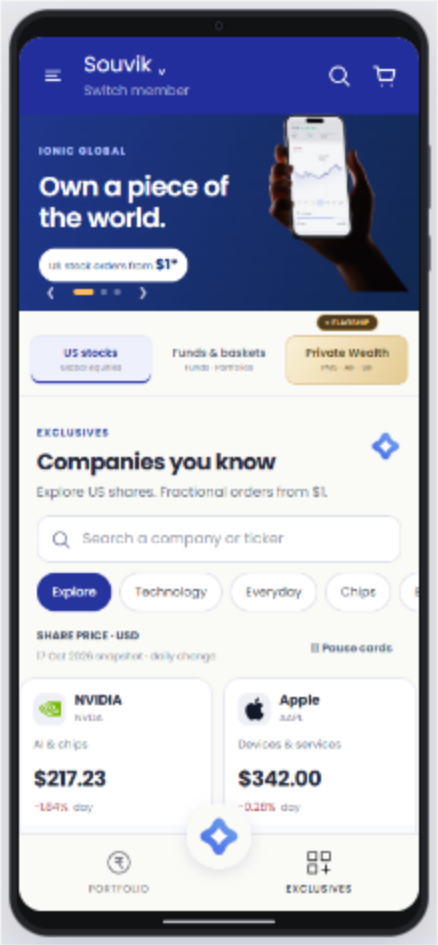

A visitor can import a portfolio and leave with insights—without finding a clear first investment.

Bring the choice forward

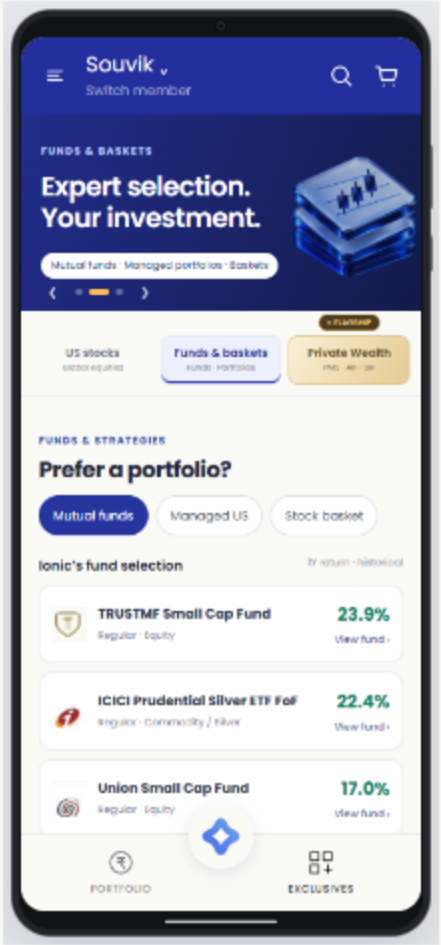

Keep the hero. Put US stocks, funds and Private Wealth directly underneath it. Show real product facts at the point of discovery.

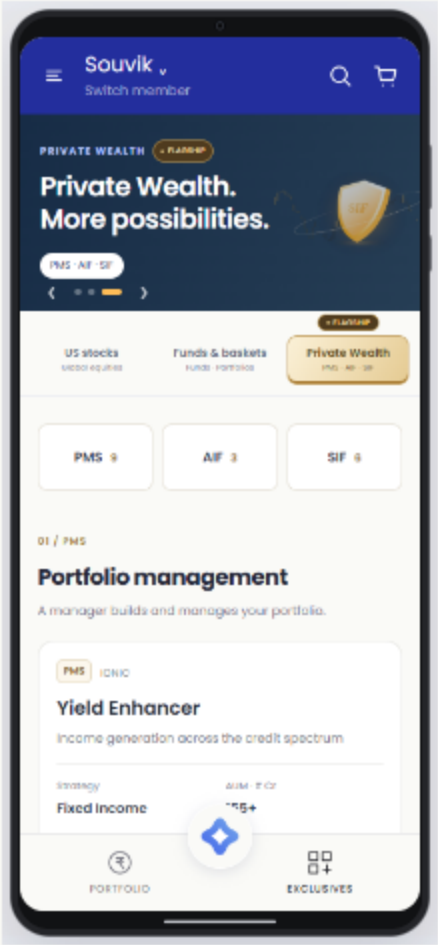

Every category earns its place up front

US stocks

Funds & baskets

Private Wealth

Give the facts before asking for commitment

1 Recognise and shortlist

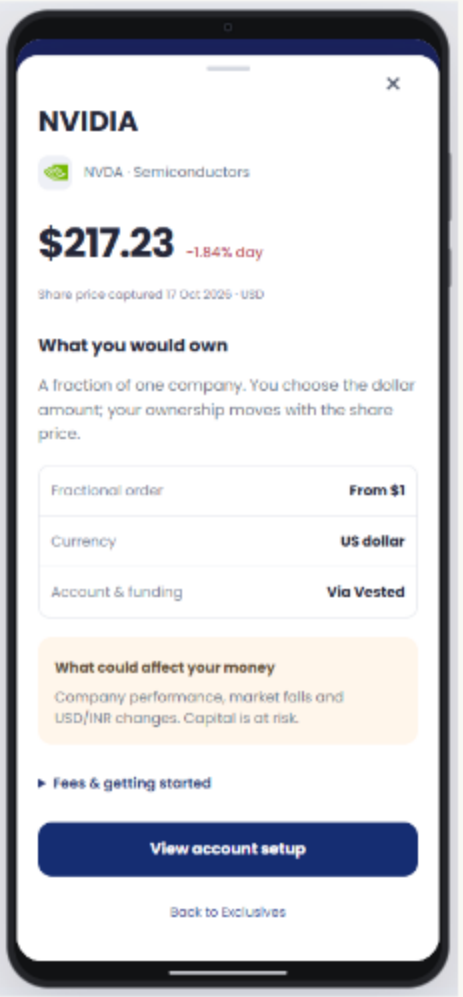

Search a company, scan its price and daily change, then compare two options.

2 Understand the investment

Keep ownership, minimum, currency, costs and risks together in the detail sheet.

3 Know what happens next

Explain account verification, funding and order review before the provider handoff.

A discovery problem we can test

If eligible first-time investors can find and compare accessible products near the top, with costs and risks together, more should reach a first unassisted investment.

Android: reading and scrolling

145 participants; Android 10 phone/tablet. Paging produced more strategic backtracking than scrolling. Supports easier revisiting and comparison.

Scope: informational reading—not investing. No universal two-screen abandonment threshold.

Choice and investment decisions

Iyengar & Kamenica: larger choice sets increased preference for simpler options in experiments and 401(k) records.

Scope: US retirement choices—not Indian HNI mobile conversion.

What still needs evidence

Measure visibility → detail → funding → first investment, split by Android/iOS. Test motion separately. No Ionic NPS, scroll-drop-off rate or causal uplift is established.
