The gap is between browsing and the first investment.

What we know

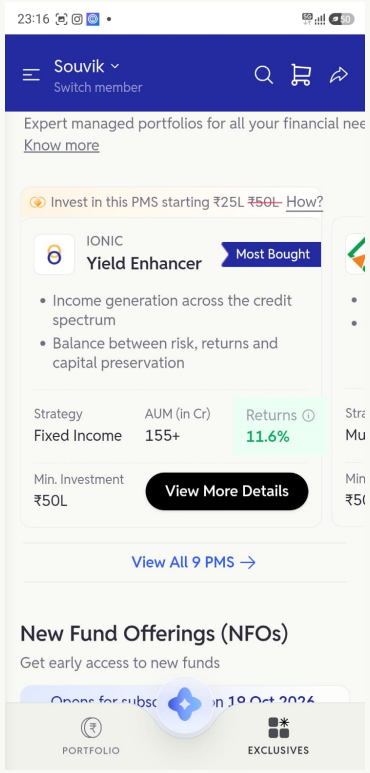

The product lead reports that people import their portfolios for insights, but often need guidance before making their first purchase.

What the screens suggest

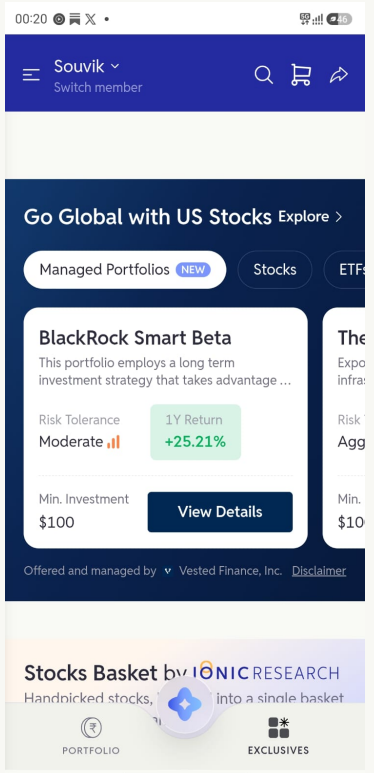

Exclusives presents long product shelves. US investing and mutual funds appear later, so users have to keep browsing to find a smaller entry option.

The hypothesis

Bring accessible products forward, with comparable facts and clear next steps. More users may then make a first investment without assisted guidance.

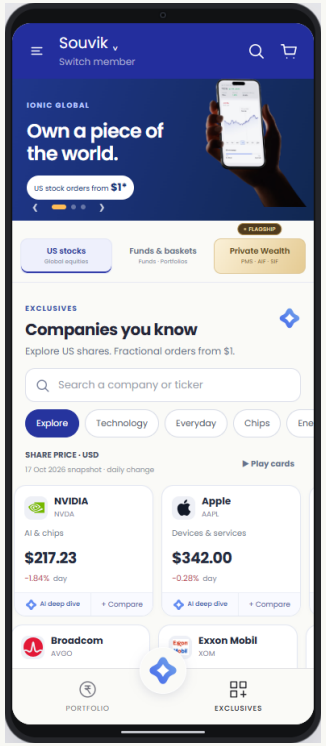

PMS shelf

US investing, later

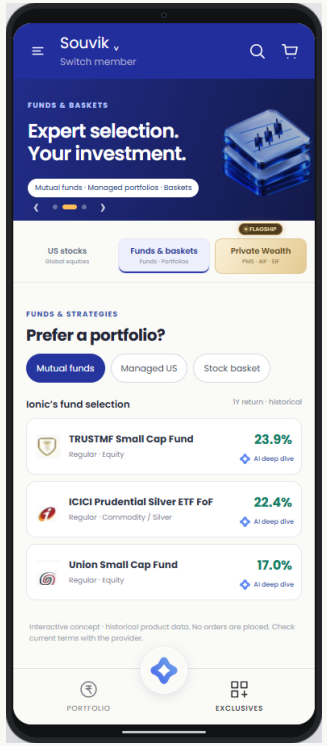

Original app captures. Scroll drop-off has not been measured.

Three clear routes, without losing the full catalogue.

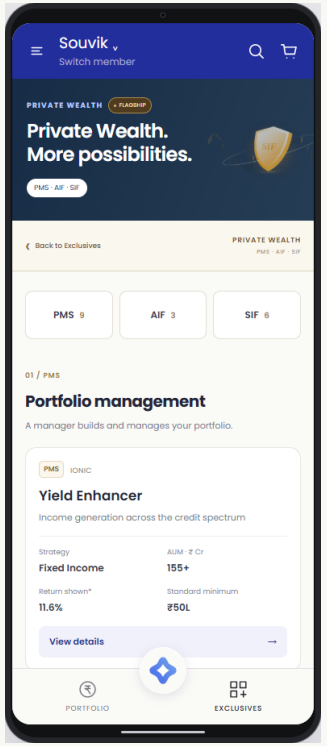

US stocks

Scan share prices and daily moves. Compare two companies, then open details or the AI explanation.

Funds & baskets

See the fund, category and labelled return period. Open details for the minimum, costs and risks.

Private Wealth

Browse all 18 PMS, AIF and SIF offerings in one catalogue, with minimums and working detail links.

Answer the questions that interrupt a purchase.

What does this company actually do?

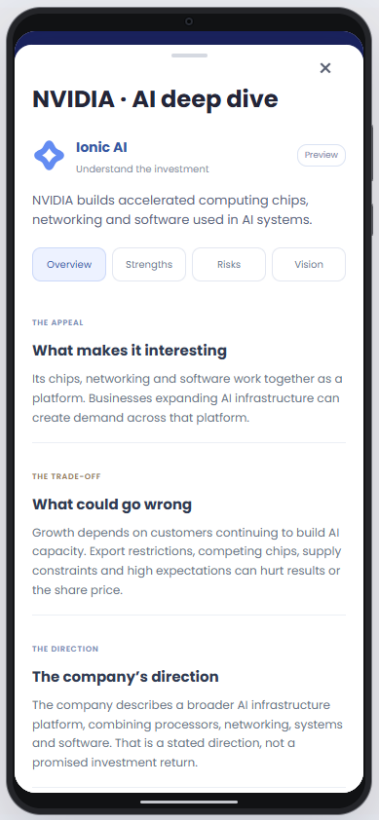

Explain the business and its main strengths in plain English. Link the company's stated plans to its filing so users can check the source.

What could go wrong?

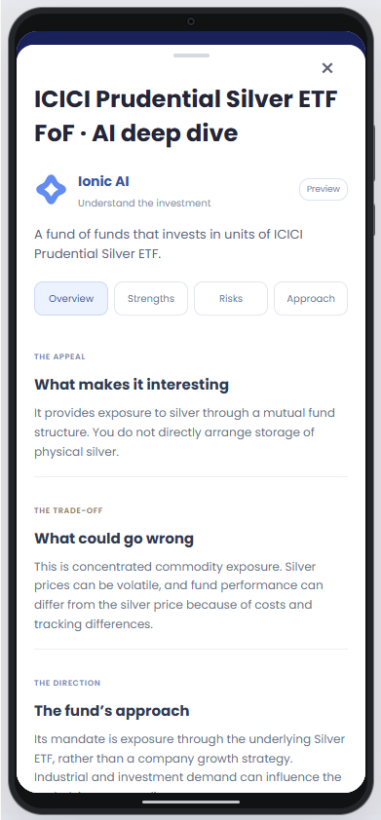

Show risks alongside the appeal. For funds, explain the mandate and exposure. Company plans and past returns are not promises.

What should I check before proceeding?

Explain fees and, for US stocks, funding and FX needs. Return users to product details to continue. Success means an informed first investment, not more AI opens.

Stock deep dive

Mutual fund deep dive

Prototype: prepared explanations with linked sources. Live AI generation and portfolio analysis are not connected.

APPENDIX

Research and hypothesis

If people can find an accessible option near the top and understand the costs, risks and next step, more should be able to complete a first investment without a call.

What the Android research tells us

A study of 145 students on Android 10 phones and tablets found that paging led to more revisiting of earlier information than scrolling. This gives us a reason to make comparison and returning to a product easier.

The study examined reading. It does not establish an Ionic scroll drop-off rate or a universal two-screen limit.

What investment research adds

Iyengar and Kamenica found that larger choice sets increased preference for simpler options in experiments and US retirement-plan data. That supports making the first choice easier to understand.

These were retirement choices. We still need to test the effect with Ionic users.

What would count as success?

Track first funded investments without assistance and check fee and risk understanding. Establish a baseline, split by Android and iOS, and test AI explanations separately from layout and motion.

APPENDIX

Give each section a clear beginning and end.

Short transitions for everyday browsing

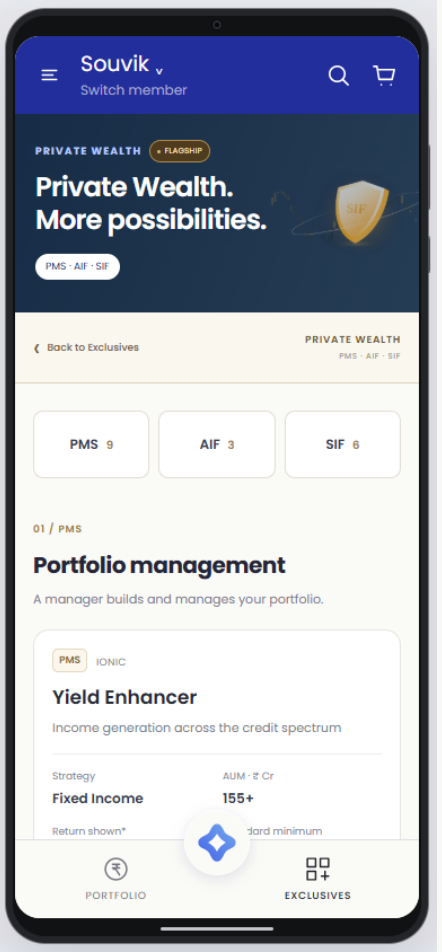

US stocks and Funds & baskets use a one-second transition to signal a change of context. The content stays one tap away.

Private Wealth gets its own space

The welcome introduces the section. Once inside, the other category tabs are hidden. Back to Exclusives plays a short exit and returns to the previous category.

Motion should not become a barrier

Skip and Escape work immediately. Reduced-motion settings remove the transitions. Test skips, exits and time to reach a product before keeping the effect.

Private Wealth after the welcome
